Lab Final Documentation

Function	Pre-condition	Post-condition	Observations
Detect(program)	<pre><pre><pre><pre><pre><pre><pre><pre></pre></pre></pre></pre></pre></pre></pre></pre>	<pre><pre><pre><pre>program>_PIF.out :</pre></pre></pre></pre>	Using Regex to fetch
	valid name for an input	contains PIF data	the program, then send
	source file	<pre><pre><pre><pre>oprogram>_ST.out :</pre></pre></pre></pre>	the tokens through
		contains ST data	filters
is_ident_const(cod)	cod : token	Boolean	Function checks if the
			current token is an
			identifier or constant
is_reserved(cod)	cod : token	Boolean	Checks if the current
			token is a reserved
			work or token.

Both ST and PIF are built on HashTable. The Analyzer is build using Functional Programming, using the functions documented above.

Run Example:

Code:

p1.in

```
entry {
    int number;

number = 0;

if(number < 5) {
    WRITE("RANDOMSTRING");
    }
}</pre>
```

p1_ST.out

```
Using HashTable for data representation

[]
[['5', 0]]
[]
[]
[['number', 0], ['0', 0], ['"RANDOMSTRING"', 0]]
```

P1_PIF.out

```
('entry', 0)
('\{', 0\)
('int', 0)
('int', 0)
('number', [3, 0])
('\;', 0)
('\=', 0)
('\{', 0\}
('\frac{1}{1}, 0)
('\frac{1}, 0)
('\frac{1}{1}, 0)
('\frac{1}, 0)
('\frac{1}, 0)
('\frac{1}, 0)
('\frac{1}, 0)
('\frac{1}, 0)
(
```

Error handling:

We'll take P1 and add some errors:

```
entry {
    int number;

    +number = -0;

    if(number < 5) {
        WRITE("RANDOMSTRING);
    }
}</pre>
```

Console:

Lexical error for +number at line 4

Lexical error for -0 at line 4

Lexical error for "RANDOMSTRING at line 7

ST:

```
Using HashTable for data representation

[]

[['number', 0]]

[['5', 0]]

[]
```

PIF:

```
('entry', 0)
('{', 0}
('int', 0)
('number', [1, 0])
(';', 0)
(';', 0)
('if', 0)
('(', 0)
('<', 0)
('5', [2, 0])
(')', 0)
('{', 0}
('{', 0}</pre>
